NEXXT AI / PRODUCT BRIEF

AI

AGENT ASSURANCE

Human-approved investigation.
Automated verification.
Legal checks and auditable evidence.

THE KEY PRODUCT BEHAVIOR

The human approves WHAT the agent may investigate.
The agent then AUTOMATICALLY verifies everything in that approved scope.

Presentation handoff for a new ChatGPT conversation

Project date: 28 October 2026

Context: VibeHack / NEXXT Summit / Raiffeisen Bank

PRODUCT CONCEPT - RESEARCH SEPARATED FROM TEAM REPORTS AND DEMO ASSUMPTIONS

SECTION 01 / AGENT ASSURANCE

Read this first

The complete, presentation-ready context in one page.

THE FINAL PRODUCT DEFINITION

Agent Assurance reviews an existing bank AI agent's output (or an employee-prepared case), spots missing or questionable evidence, **proposes a concrete investigation plan, checks the legal and internal-policy constraints, asks for human approval, then automatically executes and verifies the entire approved scope**. If a new tool or investigation scope is needed, it proposes a revised plan and asks again. It produces findings and a governance evidence pack.

The distinction to preserve

+ **Not a chatbot:** the agent decides which additional verification steps are needed and adapts based on what it discovers.
+ **Not manual verification with a button:** once the plan is approved, the agent runs the permitted checks itself; humans review plans, exceptions and final sign-off.
+ **Not a legal certification service:** it performs automated law/policy preflight with versioned rules, flags uncertainty, and records evidence supporting applicable obligations.
+ **Not a competing ARIA platform:** it is a verification and investigation layer compatible with an existing agent ecosystem.

One-sentence problem

Banking AI and employee-produced findings can contain missing, stale, contradictory, or unauthorized evidence; checking them systematically and documenting what happened requires repeatable investigation work and controls.

One-sentence solution

A human-guided autonomous agent that plans approved investigations, automatically verifies factual evidence and legal/policy constraints, resolves discrepancies where possible, and produces traceable findings for the bank.

This document is a working product and presentation brief, not a statement that Raiffeisen is non-compliant. Public facts, team-reported information, and fictional demo cases are clearly distinguished.

SECTION 02 / AGENT ASSURANCE

What we actually know

The latest ARIA feedback changes how we should describe the pain point.

Category	Evidence / finding	How to say it in the pitch
TEAM-REPORTED (28 Oct)	ARIA hosts the bank's agents; most are in IT & Data; operational tasks have become faster; most outputs are no longer manually rechecked.	Raiffeisen already operates an agent platform and has reduced manual work.
TEAM-REPORTED (specific discussion)	For the described flow, independent checks of MCP-returned facts, agent conclusions and source reliability were reported as not yet implemented.	There is an opportunity to verify selected agent outputs inside existing workflows.
PUBLIC - RBI GROUP	RBI 2025 report: AI Committee (AICO); ~300 use-case entries; AI Act implementation remit; high-risk monitoring with Internal Audit. [S1]	The bank is already actively governing AI - we augment controls, not invent them.
PUBLIC - RBI GROUP	RBI careers reports 160+ live AI use cases at group level. [S2]	AI is a live operational reality, not a future concept.
UNKNOWN	Exact ARIA access controls, local logs, per-flow policy engine, volume of exceptions, manual review time, security requirements.	We will validate the integration boundary and measure impact; do not invent ROI.

Critical wording rule

Do not say: "Raiffeisen employees manually verify every AI response" or "Raiffeisen has no AI governance." The latest contact says the opposite of the first claim, while public RBI documentation contradicts the second.

Say: "As agents expand, verifying exceptional or sensitive outputs, resolving missing evidence, and producing defensible records is a specific assurance task that can be automated." This is a product hypothesis and should be presented as such.

The unresolved business question

Where, in the ARIA ecosystem, do assurance checks remain missing or costly? The proposed demo demonstrates technical feasibility; a bank-side trial is needed to demonstrate time savings.

SECTION 03 / AGENT ASSURANCE

The real repetitive task

One focused verification-and-investigation subtask. Not an entire banking pipeline.

The trigger

A banking agent finishes a workflow or an employee submits a case. The output contains claims, source references and actions taken. Some claims are sensitive, unsupported, old, contradictory or hard to reconstruct later.

What repeats across cases

+ Find all material claims made by an AI agent or a colleague.
+ Open and inspect referenced documents, MCP results and system records.
+ Identify missing proof, wrong-entity matches, outdated versions and contradictory information.
+ Check which additional sources and data categories are permitted for this case.
+ Decide which investigation steps could resolve the uncertainty.
+ Recheck after obtaining new documents; update conclusions when new facts appear.
+ Create a consistent record of sources, checks, approvals and unresolved limitations.

What the product automates

The **entire repeatable verification sequence inside an approved investigation plan**: claim breakdown, evidence collection, relevant factual cross-checks, policy-gated tool usage, controlled follow-up investigations, exception reporting and evidence-pack generation.

What remains with people

Approving or modifying the **scope** of a proposed plan; clarifying legal ambiguity with authorized specialists; resolving genuinely unprovable claims; final review and banking decisions. A human does **not** have to manually re-run every approved factual check.

Why this is a genuine agentic task

The best next investigation step changes based on the evidence. The AI must form hypotheses, select from approved MCP tools, interpret unstructured records, decide if the evidence is sufficient, and re-plan when necessary. Simple scraping or database matching is only one subcomponent.

SECTION 04 / AGENT ASSURANCE

The final solution

Plan with the human. Verify automatically. Escalate only what cannot be resolved safely.

The product behavior contract

Step	Agent Assurance must do
01 REVIEW	Automatically inspect the received AI output or employee case and list important claims, supporting sources and gaps.
02 PLAN	Generate a specific investigation plan: actions, MCPs, source classes, purpose, data categories, time/budget limits and expected checks.
03 LEGAL PREFLIGHT	Automatically map applicable AI Act / GDPR / bank-policy checks, evaluate the proposed actions against versioned approved rules and mark unclear legal issues for specialist review.
04 HUMAN APPROVAL	Show the exact plan and legal constraints. Allow Approve / Modify / Reject. Changes create a new plan requiring new preflight and approval.
05 EXECUTE	Run the approved investigation automatically through gated, authorized MCP tools. Independently verify sources, claims, dates, identities, document validity and inconsistencies.
06 REPLAN	If the available evidence raises a new issue outside scope, stop and propose a new plan; execute it only after approval.
07 CLOSE	Provide claim-level Supported / Contradicted / Insufficient Evidence findings. Human signs off findings or requests further work.
08 DOCUMENT	Automatically generate Investigation Report + Governance Evidence Pack from actual system events, approvals, tool receipts and sources.

A precise definition of "verify everything"

The agent **automatically attempts all required verification checks within the approved scope**. It can flag every identified gap, not magically prove every claim true. Authenticity depends on reliable validation methods; missing logs stay missing; no public source creates a legal basis to process personal data. Unverifiable cases must end as **INSUFFICIENT EVIDENCE** or **LEGAL REVIEW REQUIRED**, not fabricated approval.

SECTION 05 / AGENT ASSURANCE

Final operating pipeline

The jury should see the planning, approval, autonomous execution and iteration.

1	**CASE IN**	Existing AI agent result OR employee case; capture source/MCP references.
2	**INITIAL ASSESSMENT**	Extract atomic claims; detect missing proof, contradictions, stale data.
3	**AI INVESTIGATION PLAN**	Choose proposed checks, allowed MCPs, data scope, objectives and limits.
4	**LEGAL + POLICY PREFLIGHT**	Automatically screen permitted purpose, sources, tool access, data use and applicable controls.
5	**HUMAN PLAN APPROVAL**	Approve / Modify / Reject. Modified plan goes back to preflight.
6	**AUTONOMOUS VERIFICATION**	Execute approved MCP steps; verify claims, documents and data; trace receipts.
7	**FINDINGS + GAP ANALYSIS**	Supported / Contradicted / Insufficient Evidence. Explain why.
8	**REPLAN WHEN NECESSARY**	New scope or new tools -> new plan -> new legal check -> fresh human approval.
9	**FINAL HUMAN SIGN-OFF**	Reviewer accepts findings, acknowledges unresolved issues or asks for rework.
10	**EVIDENCE PACK**	Automatically export investigation history and governance evidence.

Stop rules: the runtime always blocks disallowed calls; the agent does not use unapproved tools or continue indefinitely. It may finish with unresolved or blocked findings.

SECTION 06 / AGENT ASSURANCE

Where the AI actually acts

The agent decides how to investigate; deterministic controls decide what is permitted.

Component	Agentic reasoning / deterministic controls
Investigation Planner (AI)	Splits a complex conclusion into verifiable claims; chooses questions, evidence needs, initial plan and revisions.
Evidence Investigator (AI)	Selects the next authorized retrieval step, reads unstructured documents, forms hypotheses, compares conflicting passages.
Legal & Policy Research Assistant (AI)	Retrieves relevant regulatory/policy excerpts from a curated, versioned corpus; proposes which rules apply; cites exact sources.
Evidence Verification Tools (code)	Check exact identifiers, effective dates, structured field equality, document digests and authentic signature receipts if available.
Policy Engine + MCP Gateway (code)	Enforces approved scope, role, allowlisted tools, data categories, legal-policy decisions, budget and approval digest.
Human Review UI (person)	Approves exact plan, supplies restrictions, resolves legal uncertainty with authorized specialists, signs off final findings.
Event Ledger + Pack Builder (code)	Stores actual action receipts and generates case reports without hallucinating missing logs.

Why a second AI is not automatically "correct"

We are **not** asking one LLM to agree with another. The verifier checks each claim against original evidence, uses independent authorized retrieval when needed, runs deterministic checks for exact facts, cites relevant passages and explicitly abstains when evidence is insufficient.

Automated legal assessment is built into the product

The agent **automatically flags applicable legal and internal-policy constraints both before plan approval and during execution**. But the final authority comes from configured, bank-approved enforcement rules and qualified humans when interpretation is disputed - not free-form LLM judgment.

SECTION 07 / AGENT ASSURANCE

Main live demo / Act I

A plausible but wrong claim becomes a controlled, human-approved investigation.

Synthetic setup: corporate case verification

Customer: NOVA Logistics SRL (fictional company) **ID:** RO-DEMO-48219370 **Case:** DEMO-001
Existing bank agent claim: "NOVA Logistics SRL is currently involved in an ongoing legal dispute."
Original MCP evidence: dated legal document from March 2024 indicating a dispute was open *then*.

The first thing Agent Assurance does

+ Splits the claim into historical and current-status assertions.
+ Notices that a 2024 source cannot alone establish the status in 2026.
+ Looks at the existing MCP/source trace and identifies a missing current-status check.
+ Proposes a legally scoped investigation plan before performing any new external lookup.

The approval moment - the demo highlight

PROPOSED PLAN v1

1. Match the company registration ID against the approved registry.
2. Verify the original document's date, provenance and available authenticity evidence.
3. Query a licensed legal-status MCP; optionally use open web search for extra context.
4. Compare sources; return claim-level findings and missing proof.

Preflight: company registry allowed; licensed legal-status tool allowed; unrestricted public web search flagged as outside policy.

Reviewer: "Do not use open web search. Use only the approved company and legal registries."
Agent: creates **Plan v2**, reruns policy checks and requests approval.
Reviewer: approves the exact v2 plan.

The viewer sees that the rejected/modified plan never ran any disallowed external tool call.

SECTION 08 / AGENT ASSURANCE

Main live demo / Act II

After approval, the checks run automatically. Humans are not re-checking every source.

Live autonomous execution

+ The agent calls the approved company-registry MCP and verifies the exact fictional registration identifier.
+ It examines the original document and sees it supports a dispute in 2024, not an ongoing dispute in 2026.
+ It calls the licensed legal-status MCP and receives a newer synthetic record: status **CLOSED** in September 2026.
+ The evidence reasoner compares the conflicting dated assertions and marks the "currently ongoing" claim **CONTRADICTED**.
+ The agent notices that authenticity of the newer document has not been independently established. That additional check is **not** in the current approved plan.

The autonomous re-planning moment

Agent proposes Plan v3: "Confirm the newer record using the approved signature / official-record validation tool. If this is not possible, mark authenticity as unresolved." A human approves the new limited action. The agent executes it automatically.

Final findings - realistic outputs

Check	Result
Company identity	SUPPORTED - exact company ID matched in approved registry.
Dispute existed historically	SUPPORTED by the 2024 source.
Dispute still ongoing now	CONTRADICTED by newer, authorized status evidence.
Newer document authenticity	SUPPORTED only if a genuine independent validation receipt exists; otherwise INSUFFICIENT EVIDENCE.
Legal/policy scope	Executed within approved tools and permitted data categories; no blanket compliance certification.
Human review	Reviewer signs off findings or records unresolved issues.

What the jury should understand

The employee approved **what to investigate**. Agent Assurance then did **the actual multi-step verification automatically**, found a new gap, proposed a narrow follow-up, and generated the final record.

SECTION 09 / AGENT ASSURANCE

Other testable scenarios

Six paths demonstrate that this is not a one-script demo.

Scenario	What the starting agent / person missed	Expected Agent Assurance result
A. OUTDATED CLAIM	2024 legal status presented as current.	Look up current authorized status; flag contradiction; re-plan for provenance if needed.
B. ENTITY COLLISION	Similar company or person name; different registered ID.	Detect mismatch via exact identifiers; mark source non-attributable.
C. UNSUPPORTED ASSERTION	"Unpaid taxes" without any relevant evidence.	Search only approved sources; mark INSUFFICIENT EVIDENCE when none proves claim.
D. DOCUMENT CONFLICT	Two reports give different revenue; supersession unclear.	Investigate version metadata and authoritative status; escalate if still unclear.
E. VALID CLAIM	Revenue decrease of 20% supported by dated records.	Compute with deterministic arithmetic; return SUPPORTED and source IDs.
F. DISALLOWED TOOL	Agent proposes scraping personal data from an unapproved domain.	Legal/policy preflight blocks; approved scope cannot bypass hard prohibition.

Two independent outcome axes

Factual result per claim: SUPPORTED / CONTRADICTED / INSUFFICIENT_EVIDENCE / NOT_CHECKED.

Legal/policy plan result: ALLOWED / ALLOWED_WITH_CONDITIONS / BLOCKED / LEGAL_REVIEW_REQUIRED.

A claim can be factually supported but unlawfully obtained. A legally authorized source may be wrong or out-of-date. The system must never collapse these two checks into one generic "all green" label.

SECTION 10 / AGENT ASSURANCE

EU AI Act: the actual legal link

A legal-checking feature, not a "we certify EU AI Act" marketing claim.

Verified legal baseline as of 28 October 2026

+ **Regulation (EU) 2024/1689** is the AI Act. Its amendment **(EU) 2026/1744** is in force. Main Chapter III Sections 1-3 obligations for **Annex III high-risk** systems apply from **2 December 2027**. [S3-S4]
+ AI used to assess **natural-person creditworthiness** is generally Annex III 5(b) high-risk, with an express financial-fraud-detection exception. Classification must be assessed case by case. [S5]
+ Relevant obligations for in-scope high-risk systems include **Art. 12** record-keeping capabilities, **Art. 14** meaningful human oversight and **Art. 26** deployer monitoring, oversight and controls over relevant input data. [S6-S8]
+ **GDPR applies independently** to personal-data processing. Web availability does not automatically authorize collecting or using a person's data for banking decisions. [S9]

What our legal AI assistant verifies automatically

Check	Automated behavior / limit
Intended purpose & AI classification	Match use-case metadata to curated EU AI Act logic; flag high-risk classification for specialist review when ambiguous.
Source and tool legality	Compare purpose, role, data category, allowed sources and policy versions against configured controls.
Plan compliance	Identify prohibited actions, missing lawful-use information and policy conditions before human plan approval.
Execution compliance	Gateway checks every MCP call again; blocks revoked, unapproved, out-of-scope or over-budget requests.
Governance evidence	Record AI system ID/version, source lineage, plan revisions, approvals, reasons and gaps for relevant oversight.

The assurance system itself must also be assessed for AI Act classification based on **its own intended purpose and role**. A human approval button does not automatically take a system outside high-risk scope.

SECTION 11 / AGENT ASSURANCE

Legal checks before AND after

The user explicitly wants the agent to check applicable EU law as part of its actual work.

BEFORE a plan is approved: automated legal/policy preflight

Inputs: AI use-case classification, purpose, provider/deployer context, data categories, bank-approved MCP catalog, lawful-use rules, user role and current internal-policy version.

Question	Possible result
May this reviewer use the proposed source and tool for the stated purpose?	ALLOWED / BLOCKED
Are personal data categories necessary and within a documented legal basis?	ALLOWED_WITH_CONDITIONS / LEGAL_REVIEW_REQUIRED
Does this action change the intended purpose or bring a high-risk use case into scope?	COMPLIANCE ESCALATION
Would the proposed plan exceed restricted tools, rights or data retention controls?	BLOCK + SUGGEST SAFER PLAN

DURING execution: enforce the law-and-policy boundary

The runtime gateway checks the exact approved plan hash, authorized user, policy version, tool name, arguments, scope, data category and call budget **before each MCP invocation**. AI can recommend, but it cannot override a hard rule, even if a human tries to approve the forbidden action.

AFTER execution: produce compliance evidence

+ Show which rules were evaluated and the exact version of each rule / source used.
+ Show every plan proposal, modification, denial and approval with actor and timestamp.
+ List tool invocation receipts, source IDs, original evidence and claim-level findings.
+ List failed checks and legal uncertainties; route to Compliance or DPO if needed.
+ Export structured JSON and a readable report; do not invent missing events.

A necessary boundary

A successful legal preflight proves **that the configured controls were applied to this case**; it does not prove full AI Act, GDPR, DORA or bank-wide legal compliance. Full system classification, FRIA, provider documentation and governance remain separate obligations when applicable.

SECTION 12 / AGENT ASSURANCE

The two final deliverables

One investigation. Two outputs generated automatically from actual events.

A. Investigation Report - for the banking employee

Field	Illustrative content
Case	DEMO-001 - fictional NOVA Logistics SRL
Original finding	"Legal dispute is currently ongoing"
Automated verification	Historical claim supported; current claim contradicted by newer status record
Documents / sources	Original 2024 record; licensed 2026 status record; authorized registry reference
Unresolved items	Any authenticity or coverage limitations; no forced positive answer
Reviewer outcome	Approved findings / rejected / further inquiry requested

B. Governance Evidence Pack - for oversight and audit

Evidence group	Contents
System & purpose	AI system ID/version, intended use, case ID, role, policy corpus version
Plan & approval trace	v1 rejected / v2 approved / v3 approved; exact plan digest; reviewer identity/time
MCP activity	Allowed and denied tool calls, arguments metadata, time, tool IDs and evidence IDs
Claim mapping	Each claim, cited original document passages, check methods, result and uncertainty
Legal mapping	Applicable articles and approved policy rules evaluated; any conditions/blocks
Closure record	Final human sign-off, unresolved gaps, event-ledger digest and export timestamp

Evidence pack status must say **VERIFICATION RECORD - SUPPORTS APPLICABLE GOVERNANCE CONTROLS**, never "EU AI Act certified". If a log was unavailable in the source platform, label it **NOT CAPTURED**.

SECTION 13 / AGENT ASSURANCE

Architecture and trust boundaries

A small add-on layer for existing agent ecosystems, with enforceable limits.

Integration concept

Existing banking AI / ARIA-compatible adapter -> Case ingestion + immutable snapshot -> AI Planner + Evidence Reasoner + Legal Retrieval -> Human Plan Approval -> Deterministic Policy/MCP Gateway -> Authorized data/document tools -> Findings -> Final Review -> Evidence Pack.

Module	Job / safety condition
Agent planner + investigation brain	Creates structured plans, chooses only approved next actions, re-plans on new findings.
Policy and legal layer	Curated, versioned EU law + bank-policy corpus; cited legal analysis; deterministic enforcement rules.
MCP tool gateway	Tool allowlisting, purpose/data checks, approval binding, budgets, receipt capture, hard denial.
Verification engine	LLM evidence reading + exact matching/date/version/signature code.
Case workflow	State machine, audit events, approval versioning, retries and stop states.
Employee interface	Proposed plan, restrictions, review of evidence, final sign-off.
Evidence pack writer	Renders sources, tool receipts, policy decisions and human approvals into JSON/PDF.

MVP scope - enough for a hackathon

+ One simulated existing bank agent, one synthetic corporate case, 2-3 fixture MCP tools.
+ Real, visible approve/reject/edit loop. Re-plan when new proof is required.
+ Automatic factual and legal-policy checks, not an LLM-only judgment.
+ One complete result UI and downloadable evidence report.
+ No live Raiffeisen systems, no customer personal data, no real credit decisions or open web scraping.

Production integration needs bank-provided contracts, auth/security review, tool receipts, access policies, official source access and authorized people. The MVP demonstrates the pattern - not deployment readiness.

SECTION 14 / AGENT ASSURANCE

How we prove this works

The strongest submission shows a controlled agent, not an attractive promise.

Acceptance tests

Test	Pass condition
Plan modified by human	No MCP invocation occurs under rejected plan; new version must be approved.
Attempted unauthorized source	Policy gateway blocks action even when LLM recommends it.
Historical fact vs current claim	System separates assertions and investigates current status.
Contradiction found mid-investigation	Agent asks for approval of a limited follow-up outside initial scope.
Source cannot be verified	System abstains; no false "verified" claim or fabricated official record.
Approved plan execution	All necessary in-scope checks are executed automatically, with receipts.
Audit export	Pack reconstructs exactly what was checked, which plans were approved, and unresolved gaps.

Performance measures (no invented numbers)

+ Error detection on labeled synthetic cases, including identity mismatch and outdated information.
+ False-positive and false-negative rates; avoid a verifier that flags every claim.
+ Number of tool calls, replan cycles and cases ending with insufficient evidence.
+ Human hands-on time on matched cases with and without Agent Assurance.
+ Evidence-pack completeness measured against recorded source and approval events.

Suggested test set

Run 20-30 synthetic, labeled cases: supported claims, stale claims, wrong entities, missing proof, conflicting records and denied tools. Publish actual measured metrics, not guessed hours saved.

SECTION 15 / AGENT ASSURANCE

Three-minute presentation plan

Build the slides around one visible and believable case.

Time	Slide / on-screen content	Message to deliver
0:00-0:20	1. Title: AGENT ASSURANCE	"We do not need more banking agents. We need to verify what they do."
0:20-0:50	2. Problem: unverified data + repeatable checks	Agent outputs may be plausible yet unsupported; manual checks and audit preparation are repeatable tasks when needed.
0:50-1:10	3. Why now: agent growth + legal obligations	ARIA / RBI ecosystem already exists; AI Act high-risk oversight matters; we complement governance.
1:10-1:40	4. Solution + 5-stage visual pipeline	Review -> propose plan -> legal check -> human approval -> automatic investigation -> evidence.
1:40-2:35	5. Live demo storyboard	Reviewer restricts a tool, approves plan; agent independently discovers stale claim; proposes follow-up.
2:35-2:55	6. Evidence pack / legal controls	Shows factual outcome + automatic legal/policy check + source/approval trace.
2:55-3:00	7. Closing line	"Human control over the plan. Autonomous verification of the evidence."

Judging criteria on organizer-provided image

15% originality; **15%** problem/domain understanding; **25%** agent design/orchestration; **20%** working/testable functionality; **15%** architecture/reproducibility; **10%** business mentoring. Emphasize the plan/approve/re-plan loop and executable controls, which speak directly to the largest technical criteria.

Keep the slides clean

One concept per slide. Use a single scenario and three repeated visual motifs: PLAN / APPROVE / VERIFY. Do not spend 60 seconds listing legal articles. Show legal checks in the actual flow and cite the articles in a discreet evidence panel or backup slide.

SECTION 16 / AGENT ASSURANCE

Elevator pitch and tough questions

Use language that describes what we can demonstrate, not what we hope is true.

30-second pitch - pasteable English

AGENT ASSURANCE

"Banks already use AI agents that pull information from documents, internal systems and MCP tools. But their findings can still rely on stale, conflicting or unsupported evidence, and checking those issues must be controlled and traceable. **Agent Assurance** reviews the case, proposes an investigation plan, automatically checks the legal and policy constraints, and asks a human to approve the scope. It then autonomously verifies the evidence, re-plans only with new approval, and produces a complete investigation and governance record. **Humans control the plan. AI performs the checks.**"

Judge Q&A;

Objection	Concise defensible answer
"Why trust a second AI?"	We verify claims against original source evidence, exact data checks and independently authorized lookups; the agent must abstain when proof is missing.
"Isn't this just scraping?"	No. The AI extracts claims, identifies gaps, chooses next tools, interprets documents, and proposes iterative plans. A gateway separately enforces access.
"What is the repetitive task?"	Claim-by-claim evidence checking, follow-up investigations, version/source comparisons and assembling a repeatable audit record.
"Can it automatically verify everything?"	It automatically runs all checks required within the human-approved scope. If a fact cannot be established, it reports that limitation.
"Does AI Act require this tool?"	No. For applicable high-risk systems the Act requires relevant oversight and logging outcomes; this product helps produce evidence for them.
"Does Raiffeisen not verify anything?"	That is not our claim. ARIA has already reduced many manual checks. We are targeting a specific missing assurance workflow, subject to validation.

SECTION 17 / AGENT ASSURANCE

Source notes and evidence hygiene

What can be asserted, and exactly where to verify it.

Other inputs (not external corroboration)

Team reports: 28 Oct 2026 contact message describing ARIA, IT & Data focus and less manual verification; discussions about MCP-connected agent workflows and missing independent checks in a particular scenario. The complete internal control environment has not been audited by this team.

Working documents: "AI Act si Raiffeisen.md" (team research); "Brief Raiffeisen Bank.pdf" (participant brief); "NEXXT_Agent_Assurance_Complete_10_MD.zip" (implementation spec). Treat the PDFs and Markdown as research/spec inputs, not proof of product performance.

SECTION 18 / AGENT ASSURANCE

Next-chat handoff instructions

This document is intended to be uploaded into another ChatGPT conversation to create the pitch deck.

Copy-and-paste instruction for the next chat

TASK FOR NEXT CHATGPT CONVERSATION

"Read this PDF as the **current product and research source of truth** for NEXXT AI Agent Assurance. Build an English, high-impact, **3-minute hackathon pitch deck** for Raiffeisen. The first part should communicate the main problem, the existing ARIA ecosystem, and why verification matters; the second half should show our product, a clear visual pipeline, the human-plan-approval moment, automatic fact and legal/policy checks, the adaptive re-plan loop, and the final evidence pack. Keep text minimal, the visual design premium and technically credible. **Do not claim** Raiffeisen manually verifies most AI outputs (a contact said most checks are already automated), has no AI governance, or is non-compliant. Do not state that the EU AI Act explicitly requires an MCP verification agent. Show the fictional demo as synthetic. Make the unique value unmistakable: **humans approve the investigation scope; AI automatically executes and verifies it within enforced boundaries.** Suggest slide headlines, concise speaker notes, recommended visuals, and a timed live-demo transition."

Frozen product decisions - do not drift

+ **Product:** Agent Assurance - a small layer over existing bank agents and human case work.
+ **Core:** case assessment -> agent plan -> automatic legal preflight -> human approval -> autonomous claim/document/MCP verification -> re-plan on new scope -> final sign-off -> event-backed evidence pack.
+ **Human control:** plan approval and sensitive final decisions, not manual repetition of every verification.
+ **Automatic checks:** all checks feasible in the approved scope, including legal/policy screening; no guarantee every claim can be verified.
+ **Demo:** old 2024 dispute claim, new synthetic 2026 closing record, a human forbids unrestricted search and approves limited registries.
+ **Claims:** distinct teams/public/unknown/synthetic evidence; no invented time savings or compliance guarantees.

Recommended visual north star

"PLAN. APPROVE. VERIFY. PROVE." Build the presentation around this four-word experience. The most memorable screen is a human restricting a tool, the agent obeying the restriction, discovering a contradiction, then producing a plan and an evidence pack.

Prepared 28 October 2026. Regulatory references checked against official public EU sources; bank access, implementation details and ROI remain to be validated.
